

Database Schema

Database Schema

Multi-Tenant Rule

Every table contains `tenant\_id`. Application code must filter by `tenant\_id` for every read, update, and delete.

users

Column	Type	Notes
id	uuid	Primary key
tenant_id	text	Unique tenant key
username	text	User-provided name
api_key	text	Encrypted or hashed at rest
created_at	timestampz	Creation timestamp

tasks

Column	Type	Notes
id	uuid	Primary key
tenant_id	text	Required tenant scope
task_title	text	Short task title
task_description	text	Optional details
status	text	pending, completed, deleted
priority	text	low, medium, high
created_at	timestampz	Creation timestamp
updated_at	timestampz	Last update timestamp
completed_at	timestampz	Completion timestamp

task_logs

Column	Type	Notes
id	uuid	Primary key
tenant_id	text	Required tenant scope
task_id	uuid	Foreign key to tasks.id
action	text	create, update, complete, delete, query
timestamp	timestampz	Log timestamp

Indexes

```
create unique index users_tenant_id_idx on users (tenant_id);
create index tasks_tenant_status_idx on tasks (tenant_id, status);
create index tasks_tenant_created_idx on tasks (tenant_id, created_at desc);
create index task_logs_tenant_task_idx on task_logs (tenant_id, task_id, timestamp desc);
```
